1 Probability theory review

Solve each of the following problems and show all the steps of your working.

1. Show that the covariance matrix is always symmetric and positive semidefinite.

The $(i;j)^{th}$ element of the covariance matrix Σ is given by

$$\Sigma_{ij} = E[(X_i - \mu_i)(X_j - \mu_j)] = E[(X_j - \mu_j)(X_i - \mu_i)] = \Sigma_{ji}$$

so that the covariance matrix is symmetric.

For an arbitrary vector u,

$$\begin{aligned} u^\intercal \Sigma u &= u^\intercal E[(X-\mu)(X-\mu)^\intercal]u = E[(u^\intercal (X-\mu)(X-\mu)^\intercal)u] \\ &= E[((X-\mu)^\intercal u)^\intercal (X-\mu)^\intercal u] = E[((X-\mu)^\intercal u)^2] \geqslant 0 \end{aligned}$$

so that the covariance matrix is positive semi-definite.

2. $X \in \mathbb{R}^n$ and $Y \in \mathbb{R}^m$ are independent random variables. Their expectations and covariances are $E[X] = 0$, $\mathrm{cov}[X] = I$, $E[Y] = \mu$ and $\mathrm{cov}[Y] = \sigma I$, where I is the identity matrix of the appropriate size and s is a scalar. What is the expectation and covariance of the random variable $z = AX + Y$, where $A \in \mathbb{R}^{m\times n}$?

The expectation of Z can be obtained from the definition by applying the linearity of expectation,

$$E[Z] = E[AX + Y] = AE[x] + E[Y] = 0 + \mu = \mu$$

The covariance of Z is $\mathrm{Cov}[Z] = E[ZZ^\intercal] - E[Z]E[Z]^\intercal = E[ZZ^\intercal] - \mu\mu^\intercal$. Substituting the definition of Z, we get the expression below.

$$
\begin{aligned}
E[ZZ^\intercal] &= E[(AX+Y)(AX+Y)^\intercal] = \\
&= E[AXX^\intercal A^\intercal + YX^\intercal A^\intercal + AXY^\intercal + YY^\intercal] = \\
&= AE[XX^\intercal]A^\intercal + E[YX^\intercal]A^\intercal + AE[XY^\intercal] + E[YY^\intercal]
\end{aligned}
$$

Here we can substitute $E[XX^\intercal] = I$ and $E[YY^\intercal] = \sigma I + \mu\mu^\intercal$. Because X and Y are independent, $E[XY^\intercal] = E[X]E[Y^\intercal = 0$, similarly $E[YX^\intercal] = 0$. We get $E[ZZ^\intercal] = AA^\intercal + \sigma I + \mu\mu^\intercal$, therefore $\mathrm{Cov}[Z] = AA^\intercal + \sigma I$.

3. Thomas and Viktor are friends. It is Friday night and Thomas does not have a phone. Viktor knows that there is a 2/3 probability that Thomas goes to the party to downtown. There are 5 pubs in downtown and there is an equal probability of Thomas going to any of them if he goes to the party. Viktor already looked for Thomas in 4 of the bars. What is the probability of Viktor ending Thomas in the last bar?

The sample space is

$$
S = f\{\text{home}, \text{pub } 1, \text{pub } 2, \text{pub } 3, \text{pub } 4, \text{pub } 5\}
$$

and the probability of the events are $P(\text{home}) = 1 = 3$ and $P(\text{pub } i) = \frac{2}{15}$. We need to compute $P(\text{pub } 5|\text{not in pub } 1 \ldots 4)$. Using the Bayes rule,

$$
\begin{gathered}
P(\text{pub } 5|\text{not in pub } 1 \ldots 4) = \\
\frac{P(\text{pub } 5 \cap \text{not in pub } 1 \ldots 4)}{P(\text{not in pub } 1 \ldots 4)} = \frac{\frac{2}{15}}{\frac{7}{15}} = \frac{2}{7}
\end{gathered}
$$

4. Derive the mean for the Beta Distribution, which is defined as

$$
\mathrm{Beta}(x|a,b) = \frac{1}{B(a,b)} a^{-1}(1-x)b^{-1} \tag{1}
$$

where $B(a,b), G(a)$ are Beta and Gamma functions respectively:

$$
B(a,b) \triangleq \frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)} \tag{2}
$$

and

$$
\Gamma(x) \triangleq \int_0^\infty u^{x-1} e^{-u} du \tag{3}
$$

Hint: Use integration by parts.

---

5. Let $A \in \mathbb{R}^{n \times n}$ be a positive definite square matrix, $b \in \mathbb{R}^n$, and c be a scalar. Prove that

$$\int_{x \in \mathbb{R}^n} e^{-\frac{1}{2}x^\intercal Ax - x^\intercal b - c} dx = \frac{(2\pi)^{n/2}|A|^{-1/2}}{e^{c - \frac{1}{2}b^\intercal A^{-1}b}}$$

Hint: Use the fact that the integral of the Gaussian probability density function of a random variable with mean μ and covariance $\sum$ is 1.

---

6. From the definition of conditional probability of multiple random variables, show that

$$f(x_1, x_2, \ldots x_n) = f(x_1) \prod_{i=2}^{n} f(x_i | x_1, \ldots x_{i-1})$$

where $x_1, \ldots x_n$ are random variables and f is a probability density function of its arguments.

$$a$$

$n = 2$

$$a$$
